Computer coding programs online

Photo Courtesy: Christina/Unsplash A Master of Science in information systems (MSIS) can unlock all kinds of doors. Whether you're a professional looking to advance in the tech industry or a recent college graduate trying to make your resume stand out and maybe even snag a higher-level job, an MSIS demonstrates a command of how computer-based information systems can be used to identify and even solve problems in the business world. Online MSIS programs make furthering your own education manageable even with a hectic schedule. However, if you're going to invest your time and money in such a program, you need to make sure that the education you get is actually worth the cost. These schools may range from famous private schools to state universities, but what they all have in common are programs that teach you everything you need to excel in the information systems field.Mississippi State UniversityMississippi State University offers an accredited Masters in Information Systems online degree that's been backed by the prestigious Association to Advance Collegiate Schools of Business (AACSB). MSU not only offers flexible options to help students meet their goals (including many online survey courses if you need to make up a prerequisite) but also allows online students to pay in-state tuition rates regardless of their location. Photo Courtesy: Christina@ocintechchat.com/Unsplash Students receive a well-rounded education in information technology, database design, telecommunication, systems analysis and more. Taught by award-winning faculty, MSU's online MSIS program is perfect for future software developers, computer programmers, information security analysts, IT consultants and other professionals who plan on creating business solutions through technology.University of ColoradoIf you're looking to study both technology and business strategy, then the University of Colorado's MSIS online program is just the ticket. The school offers a 30-credit degree path which provides students with training in both the technical applications of information systems and the managerial skills needed for leadership in the world of technology. Photo Courtesy: University of Colorado/YouTube Several different specializations are offered, including business intelligence, cybersecurity and information assurance. The program includes hands-on software projects and explores topics such as networking, security, governance, business strategy, project management and more.University of MaineThe University of Maine offers more than just an MSIS for distance learners. If you're torn between focusing more on technology or business, this program lets you do both through a dual MSIS and MBA program. You'll be equally prepared to go into either field and uniquely qualified for positions that require greater expertise in both areas. Photo Courtesy: Christina@wocintechchat.com/Unsplash What's more, recent MSIS graduates have come from backgrounds as diverse as biology, English and journalism in addition to more traditional majors for such a degree. If you're looking for a hard pivot into a new career, this could be the program for you.Bellevue UniversityIf you want to learn how to become an even more valuable asset to your organization, then check out Bellevue University's MSIS online program. Students can choose from one of three concentration areas: databases, software development, or security. Classes focus on training students to assess the unique needs of an organization as well as integrating and administering new technologies to gain a competitive edge. Photo Courtesy: ThisisEngineering RAEng/Unsplash Experienced faculty members provide students with advice and instruction on the latest information tools and techniques as well as hands-on learning strategies. If you're looking to move forward in your career, then earning an MSIS online at Bellevue is a great way to go.Northwestern UniversityWhile Northwestern University's Masters in Information Systems program is a dual online and on-site program, it's just too good not to include. Based in Evanston, IL, Northwestern is one of the leading research and teaching universities in the United States. Their MSIS program offers eight specializations to choose from: artificial intelligence, data science, database and internet technologies, information systems management, project management, information systems security, health informatics and Information Systems. Photo Courtesy: ThisisEngineering RAEng/Unsplash The curriculum covers everything from design and implementation to evaluation and modeling, familiarizing students with everything they need to help organizations adapt new technologies. If you're looking to make excellent business contacts and enjoy hands-on learning, then Northwestern is definitely worth looking into.West Texas A & M UniversityIf you already have experience in information systems and analytics and are looking to take your career to the next level, then West Texas A & M University's program may be for you. Their online program is designed for working professionals who already have a bachelor's degree from an accredited university or two or more years of hands-on experience in computer programming or a related field. Students are allowed to take up to 6 years to complete the program, although many students complete it in as little as two. Photo Courtesy: Jeswin Thomas/Unsplash Students who complete the 36-credit online program are eligible to receive a Master of Science in computer information systems and business analytics (MS CISBA). Focuses include quantitative analysis; computing and data mining; web and mobile development; business integration and cybersecurity; and technology planning and product management. MORE FROM ASKMONEY.COM The best online coding courses offer a convenient way to start or continue your journey in coding, gaining new coding knowledge and skills on-demand wherever you are. Whether you're just dipping your toes and want an introduction to initial basic coding skills or you're an experienced coder looking to build on your skills or move into a new coding language, there are lots of online courses on offer. Online coding courses aren't all created equal, though, and there are courses that lack the structure, content and practical tasks to provide adequate training. So to help provide some guidance, we've reviewed a bunch of online coding course providers to make a selection for anyone looking for the best online coding courses. Many of the providers below offer several coding courses covering different topics for different levels. We've chosen them based on our overall impression of the quality of their course structures, resources, expert knowledge and the existence of a community for support.Generally, paid-for coding courses provide the best experience and more thorough training, but we've also included the best free online coding courses that we've found since these can offer a great no-risk introduction for anyone who's not yet sure that code is something for them. For the best experience writing code, consider investing in one of the best monitors for programming to help minimise eye strain during study sessions.The best online coding courses to start today(Image credit: Coursera)For a well-regarded, academically rigorous coding course, we highly rate Coursera. The site was founded by Stanford professors, and continues to work with universities, colleges and corporations to offer a comprehensive suite of courses, degrees and specialisations. But let's talk about coding in specific. It might come as a surprise, but there are a good number of free courses on offer with Coursera, though be aware that you'll generally have to pay for the final certificate. There are good beginner-level courses: we'd recommend looking at 'Web Design for Everybody: Basics of Web Development & Coding' from the University of Michigan if you're starting from scratch. More advanced users may want to try something like IBM's 'Applied AI with Deep Learning' course. Wherever you are on your coding journey, we've found Coursera to be a superb choice for learning new coding skills.(Image credit: Pluralsight)If you click through to a few of the sites we've listed in this guide, Pluralsight might strike you as one of the best-looking. We love the platform's clear, easy-to-use layout. Course content is also top-notch in our experience. You can set up a 'path' through a number of different courses to give yourself a comprehensive grounding in multiple subjects, or just opt for a single course on one topic. We also rate the videos, which have a kind of quirky charm to them. Some users have compared the experience to watching Bill Nye, which is a solid recommendation in our book. It certainly beats a lot of the quite dry resources offered by many online course providers. The way it works is pretty simple – you view the video, then work on your tasks, checking back in with the video for pointers if needed. There's also a system whereby you can earn points in classes to 'buy' answers, providing a handy lifeline if you get truly stuck. (Image credit: Udemy)Udemy offers an expansive catalogue of courses, filled with thousands of other topics besides web and technology. Whatever area of coding you're looking to learn about, we're pretty confident that you'll find a course for it here. While Udemy isn't explicitly coding focused, a glance at the site is enough to indicate that coding is a huge part of its core offering and appeal. One of the first things you'll like see on the homepage is a selection of courses for the coding language Python, and there's plenty more to dig into.While the vast number of courses available (over 183,000 at the time of writing) does make it tricky to dig out the good stuff, if you have a little patience and willingness to sift through what's there, you're highly likely to find something you're looking for. Also, the prices range from free to hundreds of dollars, so there's suitability for the majority of budgets.(Image credit: Free Code Camp)One of the best resources for those who want to learn to code without spending any money. Free Code Camp is a non-profit and interactive learning platform. It offers more than 6,000 tutorials, and the people behind the site claim that it has more than 40,000 graduates working at tech firms, including giants like Microsoft and Google. The learning at Free Code Camp is based on an integrated code editor. It lets you save as you go and starts you off with a thorough grounding in the basics. Its courses offer certifications, generally requiring you to build five required projects to prove you've mastered the relevant skills. There are courses focused on responsive web design, machine learning, JavaScript algorithms and loads of other topics. We find it to be well designed to fit around other commitments and a good option to gain a grounding in the skills you need for coding jobs.(Image credit: Shaw Academy)Shaw Academy offers a suite of coding courses, and they're pretty popular: the Web Design course has more than a million graduates. Certified by Austin Peay University, the academy's courses are mainly pitched towards beginners, and they're well placed for anyone who's just starting out on their coding journey. It offers courses in Python programming, and even a coding for kids course for the little ones. We'd particularly recommend looking at Shaw Academy if you're looking to create an app, as the coding and technology class covers this specifically. There's also help on offer for making a website using HTML, CSS and JavaScript – also, a generous free trial period of four weeks gives you a good long time to try it out before deciding if you want to sign up properly. Plus, if you do, there are a few different payment plans available. Envato Tuts+ is a broad training platform that offers courses on several aspects of design, from coding and web design to 3D and illustration. We like the way you can choose exactly how you want to learn, whether that's by video-based lessons, tutorials or ebooks, including the ever-popular A Book Apart series. An Envato Tuts+ monthly subscription gives you access to all these learning materials, plus its excellent design resource library, Envato Elements.(Image credit: Skillshare)Skillshare is a subscription-based service that offers thousands of courses in different subjects. Many of its best coding courses are taught by world-class web developers such as Rachel Andrew, Christian Heilmann, and Jenn Lukas. Courses come complete with supplementary materials created by the instructors, and they include projects for you to apply your new skills to. There's also an iOS or Android app, which we've found to be a convenient option to stream courses on the go.(Image credit: General Assembly)Fancy live coding workshops? General Assembly organises livestreams, ranging from 'Intro to coding' to 'Python Programming Crash Course'. Some of them are free but most are paid for. To access them, you need to buy an e-ticket and then log in to the livestream when it starts (just be aware of timezone differences!). For those who lack the motivation to learn at their own pace, live workshops offer a good way to 'force' yourself to learn. On top of that, having something in the calendar means you're more likely to find the time to do it. If you do miss the class, however, you'll usually be able to get hold of a recording later.(Image credit: Udacity)Udacity offers solid guides on many different subjects, with a big selection of free courses. It also has a range of 'nanodegrees', which cover in-demand skills. One part of the structure that we've found very useful is that all of Udacity's coding courses are summarised before you begin, outlining the difficulty level, why the course is important, any prerequisites for taking it and the project you'll complete at the end. It's good to know exactly what to expect.(Image credit: Treehouse)Treehouse aims to make learning fun. The structure is simple: learn from the video courses (which are regularly refreshed to reflect industry changes), practise your new skills through quizzes and challenges, and earn badges to reflect the skills you've already mastered. We found this gamification is actually very well designed and can really help to motivate learning. It also has one of the most comprehensive libraries of educational materials on this list. Not only does it offer a large variety of coding courses, but it also includes 'workspaces' where you can try out new projects in your own time and a library with videos of talks from industry professionals. It offers an iPad app to continue your learning there, too.(Image credit: Codecademy)Codecademy is another fun option. It's a free source of coding courses that's easy to set up, and it allows you to create goals for yourself and find the skills you want to learn. These may range from applicable things like creating a portfolio site to silly, fun things like animating your name or building a CSS galaxy. There's also a paid Pro version, which gives you access to exclusive quizzes, projects, and customised learning paths. Mijingo is an online learning resource that features step-by-step video tutorials for both web design and development. Be warned, its online coding courses aren't for beginners: they're specifically aimed at helping web professionals get up to date with the latest developments. Courses focus on topics including Git, Craft, ExpressionEngine, Twig. Alternatively, you can pick a lesson on a small, specific element of a broader topic. Stream the videos or download them to any device to watch at your leisure. We've found the courses to be cohesive and thorough, and some offer transcripts, starter files and other resources.(Image credit: Sitepoint)Sitepoint offers a range of 'paths' to follow to learn particular coding skills. These offer a clear journey through a specific subject, such as HTML and CSS, Angular, or JavaScript. You follow these online coding courses at your own pace to complete your goals. Sitepoint also offers a range of books, courses and screencasts to supplement your learning.(Image credit: BT)If you have kids between the ages of six and 11 that are interested in learning to code, BT has found a way of teaching online coding in a way that's great fun for youngsters. At Code A Cake, a colourful website created by AnalogFolk, you create a robot-staffed bakery in order to bake a cake, using the art of coding. Yes, it sounds strange, but we think this is a clever way to get kids interested in picking up some basic coding skills. Parents may well learn a thing or two along the way, too.(Image credit: EDX)EDX brings together coding courses from top universities such as MIT, Georgia Tech, UC Berkeley, and Harvard, as well as A-list companies like IBM, Microsoft, W3C and Linux, for you to learn online. There are a number of free coding courses to get you started and help you choose your path for future learning, although you'll need to pay to get a validated certificate upon completion.to choose the best online coding course for you we recommend considering your personal learning style (for example, verbal, visual, auditory or kinesthetic). A mix of all four is often the most effective route; for example, a video-based course that has transcripts you can read with diagrams and images and practical tasks that you have to complete. App-based courses are often good for achieving this mix. Another thing to look out for is whether the coding course offers opportunities for real problem-solving. A lot of video courses have you coding along with an instructor but don't challenge you with the kinds of real problems you would have to solve in on a job – things like analysing cause and effect, debugging, and refactoring. Finally, look at whether the course you're considering has a community where you can ask and respond to questions from other students. Sometimes you can learn as much from the community of other students since this provides opportunities to share problems and queries and reinforce learning with the help of others.What code to learn will largely depend on the sector you want to work in. For example, if you want to work in mobile apps, you'll want to learn Java, Kotlin and Swift. If you want to work in gaming, you'll need C++ and Unreal Engine and/or C# with Unity Engine. You'll want to learn C language for operating systems, and for websites you'll want JavaScript or TypeScript for front-end, Python or Ruby for back-end. For more on this, see our guide to the 4 most in-demand programming languages.Certification is another factor to consider when choosing the best coding course. It can be very beneficial to have evidence of your study that you can take to interviews or add to your LinkedIn profile. Whether you need certification to prove your new skills might depend on where you want to work since qualifications are more likely to be requested if you're applying for an in-house position. Most courses will offer some sort of validation to certify that you've completed their syllabus, but, how much that is worth can depend on how recognised the course provider is, which is why we've been sure to include some highly recognised online coding course providers in our list above.No, there is certainly no need to learn to code to build a website. If you're not sure about taking the plunge into coding and want to get a website up and running as quickly as possible, you can do that with one of the best website builders together with the best web hosting and get online in no time at all with no coding necessary. Web builders provide templates that you can then customise to suit your needs. Of course, how much you can customise the site is limited. And while web builders are getting better all the time, knowing at least something about html and CSS will certainly be useful if you want to do anything beyond the most basic customisations to get your site how you want it. You might find some web design inspiration in our selected examples of great CSS animation, and parallax scrolling and our recommended steps to achieve the perfect website layout.Related articles:Round up of today's best deals
